ABSTRACT
In this paper, we proposed a hierarchical disparity estimation scheme using region matching. The proposed method is composed of hierarchical structure, region-based disparity estimation, and disparity refinement. In the hierarchical structure, three procedures, color transform, edge detection and sub-sample, are performed. To perform disparity estimation, a cost function based on normalized cross correlation as well as color and spatial features is developed and used as a measurement in the proposed disparity estimation method. And get a high resolution depth map. In disparity refinement, the disparity values in occlusion regions are estimated and patch outlier. According to experimental results, our proposed scheme can perform disparity estimation well.

Keywords: stereo matching、disparity estimation、region based、hierarchical

Table of Contents
第一章 緒論........................................... 1
1.1 研究動機........................................ 1
1.2 系統概要......................................... 3
1.3 相關技術......................................... 5
1.3.1 困難之處...................................... 6
第二章 系統描述.................................. 8
2.1 階層式架構..................................... 8
2.2 區域切割......................................... 9
2.2.1 Mean shift segmentation.......................... 10
2.2.2 Labeling........................................... 12
第三章 視差估計................................. 16
3.1 何謂視差....................................... 16
3.2 本論文的估測方法............................. 18
3.2.1 色彩轉換........................................ 19
3.2.2 Sobel 運算子.................................... 20
3.3 成本函數......................................... 21
3.3.1 正規化交互相關函............................. 22
3.3.2 顏色特徵........................................ 23
3.3.3 空間相關性.................................... 24
3.4 視差修補......................................... 24
3.5 取得高解析度視差圖............................. 28
第四章 實驗結果與分析...................... 29
4.1 系統執行環境與定義評估標準............... 29
4.2 視差修正比較.................................... 31
4.3 實驗數據比較................................. 50
4.4 中間視角合成................................. 52
第五章 結論與未來研究方向.................... 55
5.1 結論............................................. 55
5.2 未來研究方向................................. 55
