ABSTRACT

The major components of liquefied petroleum gas (LPG) are propane and butane. LPG is commonly used in national defense, industrial fuels and civilian gas supplies. Propane and butane are mixed at specific ratio for different applications. For current chemical industries, storage of LPG is classified as large-scale reservoirs (>10000 M3, normal pressure, low temperature) and small-scale reservoirs.

Keywords: Propane; Butane; Liquefied Petroleum Gas
