ABSTRACT
This thesis is focused on designing and realizing the balancing control system of an unmanned bicycle. The control system of the unmanned bicycle is based on the steering control system that is implemented by PID controllers in an industrial personal computer (IPC). A data measurement system for the bicycle is developed, which measures the roll angle of the bicycle body, the steering angle of the front fork, and the bicycle speed. The steering control system driven by a servomotor is designed to simulate the steering control of the rider. These data are provided to the controller implementing the calculation. The bicycle speed and roll angle are controlled independently. The speed control is achieved by one control loop with a PID controller and a PWM, and the roll-angle control by two control loops, where the outer is to generate the reference steering angle by a PID controller, and the inner is to control the steering angle following the reference, also by a PID controller. The data acquisition program and the control program used are written by LabVIEW. The experimental data are used to show the feasibility of the proposed system and controller.

Keywords: Riderless Bicycle、PID、IPC

Table of Contents
第一章 緒論
  1.1 前言
  1.2 文獻回顧
  1.3 研究目的與本文架構
第二章 無人自行車系統元件與控制系統
  2.1 自行車硬體元件說明
  2.2 無人騎乘自行車控制機構與元件說明
第三章 車速控制器與前叉轉向控制器之設計
  3.1 PID控制原理和特點
  3.2 車速控制器之設計
  3.3 車速控制實驗
  3.4 前叉轉向控制器之設計
  3.5 前叉轉向控制實驗
第四章 無人自行車硬體控制實驗
  4.1 自行車姿儀資料擷取實驗
  4.2 無人自行車穩定行駛控制實驗
第五章 結論與未來發展
  5.1 未來發展
