ABSTRACT

A PAPR reduction scheme which transforms a 16-ary OFDM signal-to a 4-ary one, is proposed for OFDM communication systems. The simulation results are utilized to evaluate their performances, where a CCDF 10-3 is used for the basis of performance evaluations. From our simulation results and compared to the PAPR of the 16-ary OFDM signals, the proposed scheme provides a PAPR reduction of 3.6dB that is 1.6dB higher than that achieved by transforming a 16-ary 8-ary OFDM signals.
