ABSTRACT

In this study effects of culture conditions on growth of *Nannochloropsis* sp. were examined using response surface methodology and a mathematical modal was established to find the optimal condition for biomass production. The appropriate range of each factor was determined for growth with the method of one-factor-at-a-time. Then central composite design was set up for factors of sodium bicarbonate concentration, salt concentration and pH based on the results obtained. The results by one-factor-at-a-time method showed that the suitable culture condition for *Nannochloropsis* sp. was with 20 g/L of sodium bicarbonate and pH 8.5, 0.3 g/L of sodium nitrate in medium. Based on the results by one-factor-at-a-time, a central composite design of three factors, each with two levels, was designed, and the experiments were carried out and results were analyzed with statistical software, Minitab. The optimal culture condition for *Nannochloropsis* sp. was as follows: sodium bicarbonate 30.8 g/L, salt 20.3 g/L, and pH 8.27, and biomass 1 g/L.

Keywords : *Nannochloropsis* sp., response surface methodology(RSM), one-factor-at-a-time, central composite design
