## ABSTRACT

*Pseudomonas aeruginosa* TKU002 is the production bacillus for catechol 1,2-dioxygenase ( abridged as C12O ) screened by this laboratory, capable of accumulating intermediate product catechol, with decomposition into cis,cis-muconic acid by the C12O produced by the bacillus. The preferable culture medium for TKU002 to yield C12O is 0.05% urea, 0.3% glycerin, 0.6% Sodium Benzoate. Cultured at 30°C for 3 days, the bacilli are retrieved for ultrasound homogenization. The supernatant from centrifugation is purified into a singular C12O enzyme through separation of nucleic acid with streptomycin sulfer and purification steps by DEAE-Sepharose CL-6B and Sephadryl S-100, with molecular weight about 22 kDa, iso-electric point less than pH 5. In the substrate specificity respect, C12O shows a higher activity to pyrogallol; as for the influence of metallic ions on the enzyme, Zn<sup>2+</sup> inhibits its activity, while Mn<sup>2+</sup> promotes it.

Keywords : 鄰苯二酚；苯甲酸鈉；兒茶酚
