ABSTRACT

Formation of Al₂O₃-reinforced borides (TiB₂ and NbB₂), silicides (Ti₅Si₃ and Nb₅Si₃), carbides (Ti₃SiC₂ and TiC), and intermetallics (TiAl) was conducted by self-propagating high-temperature synthesis (SHS) in argon. The synthesis reaction involves the elemental reaction and four different types of the thermite systems, including Al-TiO₂, Al-SiO₂, Al-B₂O₃, and Al-Nb₂O₅. Effects of Al₂O₃ content were studied on the propagation mode of combustion wave, flame-front velocity, reaction temperature, and product composition. On the other hand, different types of the thermite reactions were used for the synthesis of the same composite to understand the variation of Al₂O₃ content with type of the thermite system.

Keywords : Self-propagating High-temperature Synthesis ; Thermite reaction ; Al₂O₃ ; Composite
