ABSTRACT

Due to its extensibility and self-definability, XML is becoming the de facto standard for data exchange on the Internet. Since it is a fairly new descriptive language for data structures, it lacks some utilities, such as indexing and querying tools, normally found in existing relational database environment. As a result, new users of this language may face the difficulties in querying XML data. To lessen the burden of learning the query language, XQuery, for XML, we develop a system that uses the querying technique of relational database and on the XML data. In our research, we first convert the schema of the XML data to a relational schema and the data are fed into the relational database. The users then have the ability of using various relational techniques to query the data. To ensure the outcome fulfills at least the standard of second normal form, we develop a set of rules to remove the duplicity of XML data and maintain the integrity of the output data. Our experimental results are positive and we believe the system can largely reduce the efforts of querying XML data.

Keywords : relational database、cardinality、XML Schema、normalization

第一章 緒論	1
1.1 研究背景	1
1.2 研究動機及目的	2
1.3 論文各章提要	4
第二章 相關研究	5
2.1 DTD簡介	5
2.2 XML Schema簡介	6
2.3 DOM解析器	12
2.4 DTD文件與關聯式資料庫之間的轉換方法	13
2.4.1 CPI演算法	14
2.5 關聯式資料庫轉換成XML文件的方法	18
2.5.1 NeT演算法	18
2.5.2 CoT演算法	21
2.6 Schema文件與關聯式資料庫之間的轉換方法	22
2.7 XML文件與關聯式資料庫混合的轉換方法	25
2.8解決XML文件與關聯式資料庫間轉換產生的問題	29
第三章 研究方法	31
3.1 XML Schema的前置處理規則	32
3.2 Schema轉換為關聯式架構規則	43
3.3 系統流程圖	52
第四章 實驗成果	54

第五章 結?與未?發展 59

5.1 結? 59

5.2 未?發展 59
